3.2 in memory spend $O(n^2)$, that is $O(300.000^2)$ which gives a total of 90.000.000.000

3.5 the complexity for the worst case is $O(\text{vertices}^2)$

3.6

The V is equivalent to the nodes or objects that are in the network.

The E is equivalent to the actions, the part where you check if it is "Bicolorable" or "Not Bicolorable".

N equals the rows of the matrix and M equals the columns of the matrix.
